

Chapter 5

Electronic mail security

Outline

- Pretty good privacy
- S/MIME
- Recommended web sites

Pretty Good Privacy

- Philip R. Zimmerman is the creator of PGP.
- PGP provides a confidentiality and authentication service that can be used for electronic mail and file storage applications.

Why Is PGP Popular?

- It is available free on a variety of platforms.
- Based on well known algorithms.
- Wide range of applicability
- Not developed or controlled by governmental or standards organizations

Operational Description

- Consist of five services:
 - Authentication
 - Confidentiality
 - Compression
 - E-mail compatibility
 - Segmentation

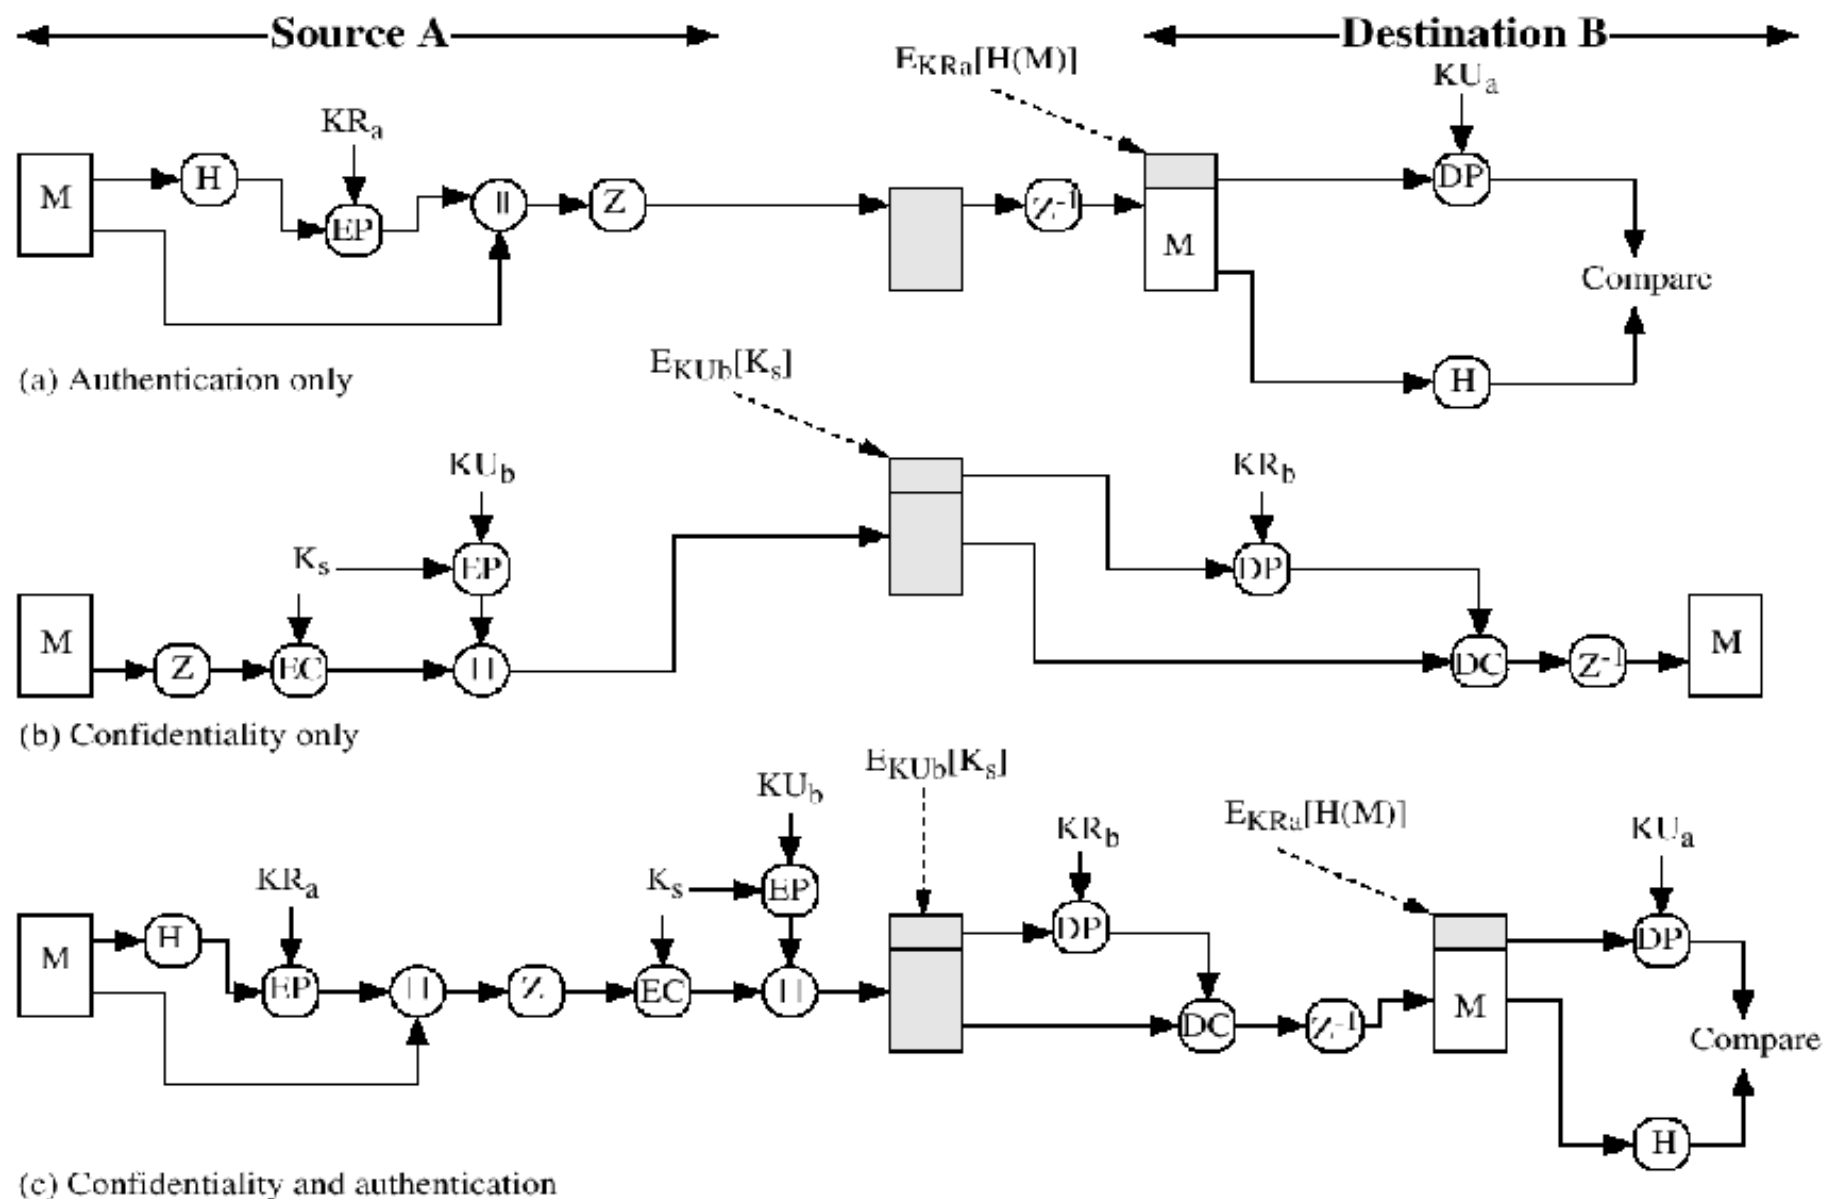

Figure 5.1 PGP Cryptographic Functions

Henric Johnson

Compression

- PGP compresses the message after applying the signature but before encryption
- The placement of the compression algorithm is critical.
- The compression algorithm used is ZIP (described in appendix 5A)

E-mail Compatibility

- The scheme used is radix-64 conversion (see appendix 5B).
- The use of radix-64 expands the message by 33%

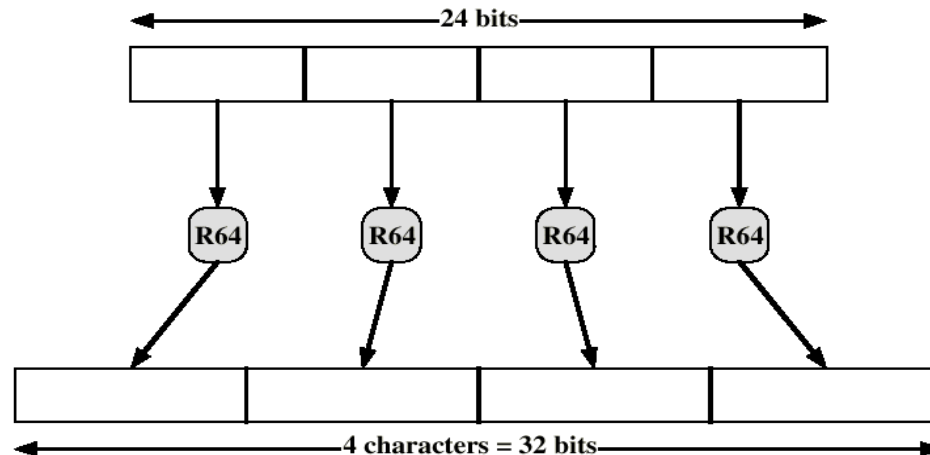

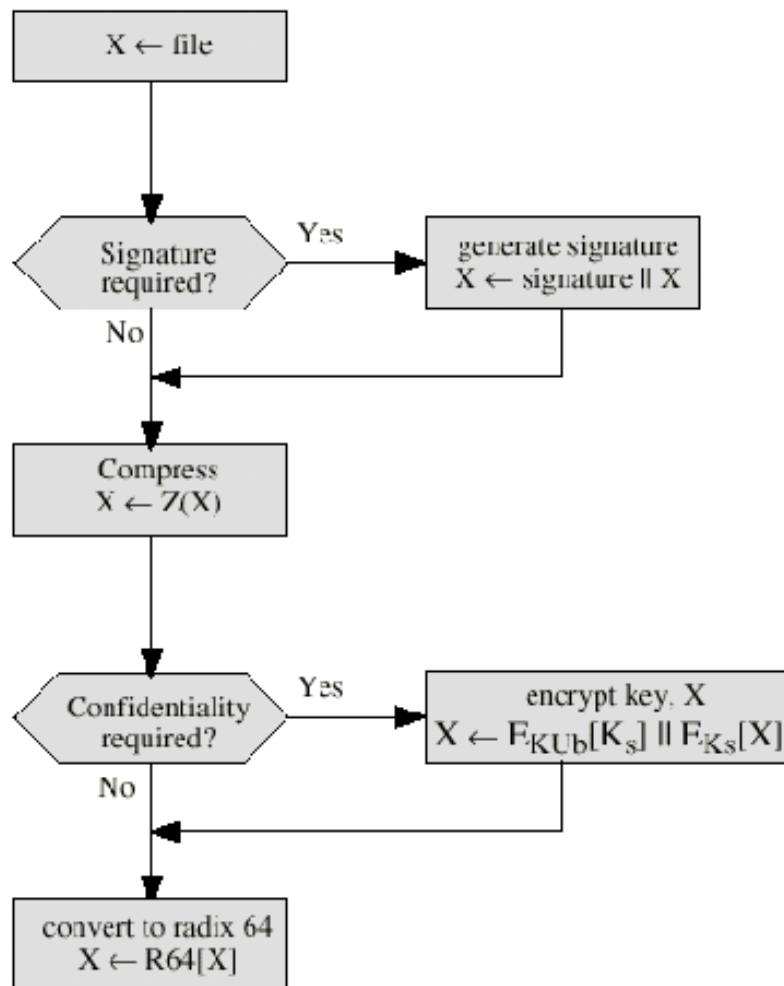

Figure 5.11 Printable Encoding of Binary Data into Radix-64 Format

Segmentation and Reassembly

- Often restricted to a maximum message length of 50,000 octets.
- Longer messages must be broken up into segments.
- PGP automatically subdivides a message that is too large.
- The receiver strips off all e-mail headers and reassembles the block.

Summary of PGP Services

Function	Algorithm Used
Digital Signature	DSS/SHA or RSA/SHA
Message Encryption	CAST or IDEA or three-key triple DES with Diffie-Hellman or RSA
Compression	ZIP
E-mail Compatibility	Radix-64 conversion
Segmentation

(b) Generic Reception Diagram (to B)

Figure 5.2 Transmission and Reception of PGP Messages

Format of PGP Message

Content

Operation

Private Key Ring

Timestamp	Key ID*	Public Key	Encrypted Private Key	User ID*
.
.
.
T_i	$KU_i \bmod 2^{64}$	KU_i	$EH(P_i)[KR_i]$	User i
.
.
.

Public Key Ring

Timestamp	Key ID*	Public Key	Owner Trust	User ID*	Key Legitimacy	Signature(s)	Signature Trust(s)
.
.
.
T_i	$KU_i \bmod 2^{64}$	KU_i	trust_flag _i	User i	trust_flag _i		
.
.
.

* = field used to index table

Figure 5.4 General Structure of Private and Public Key Rings

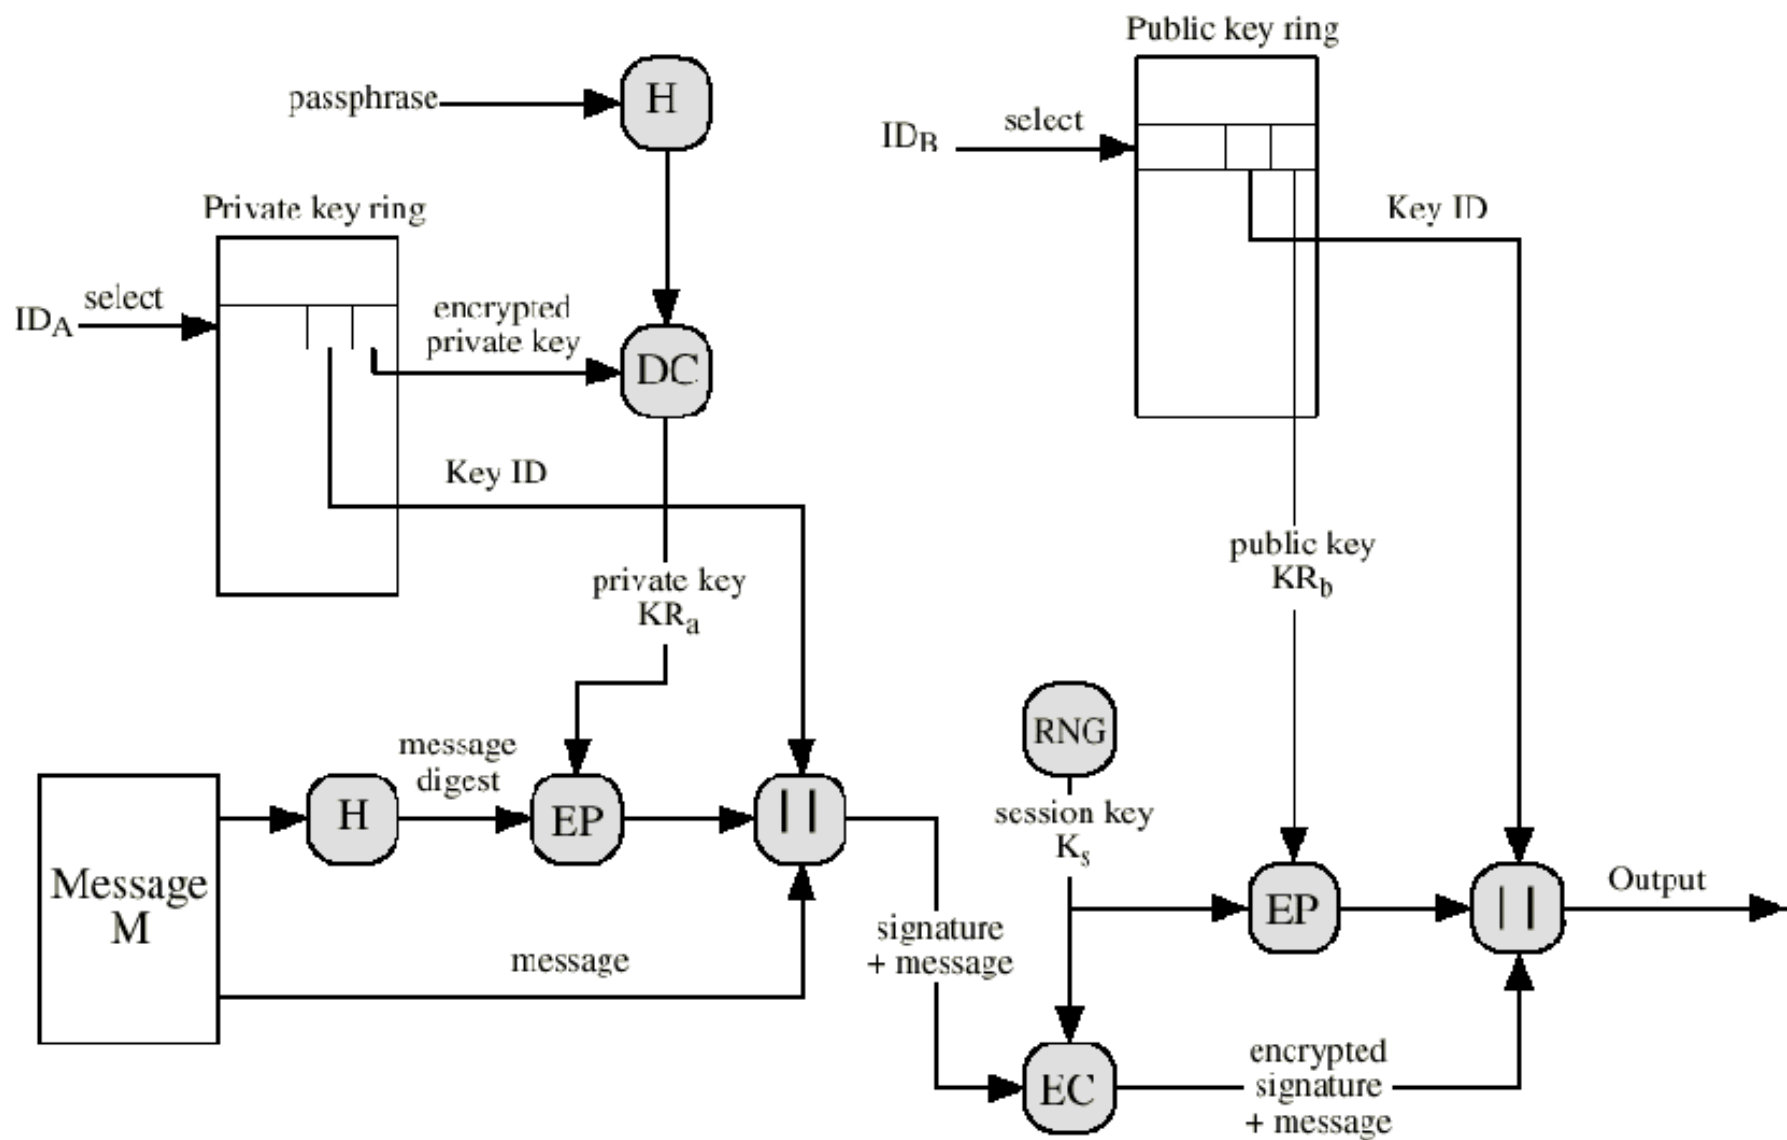

Figure 5.5 PGP Message Generation (from User A to User B; no compression or radix 64 conversion)

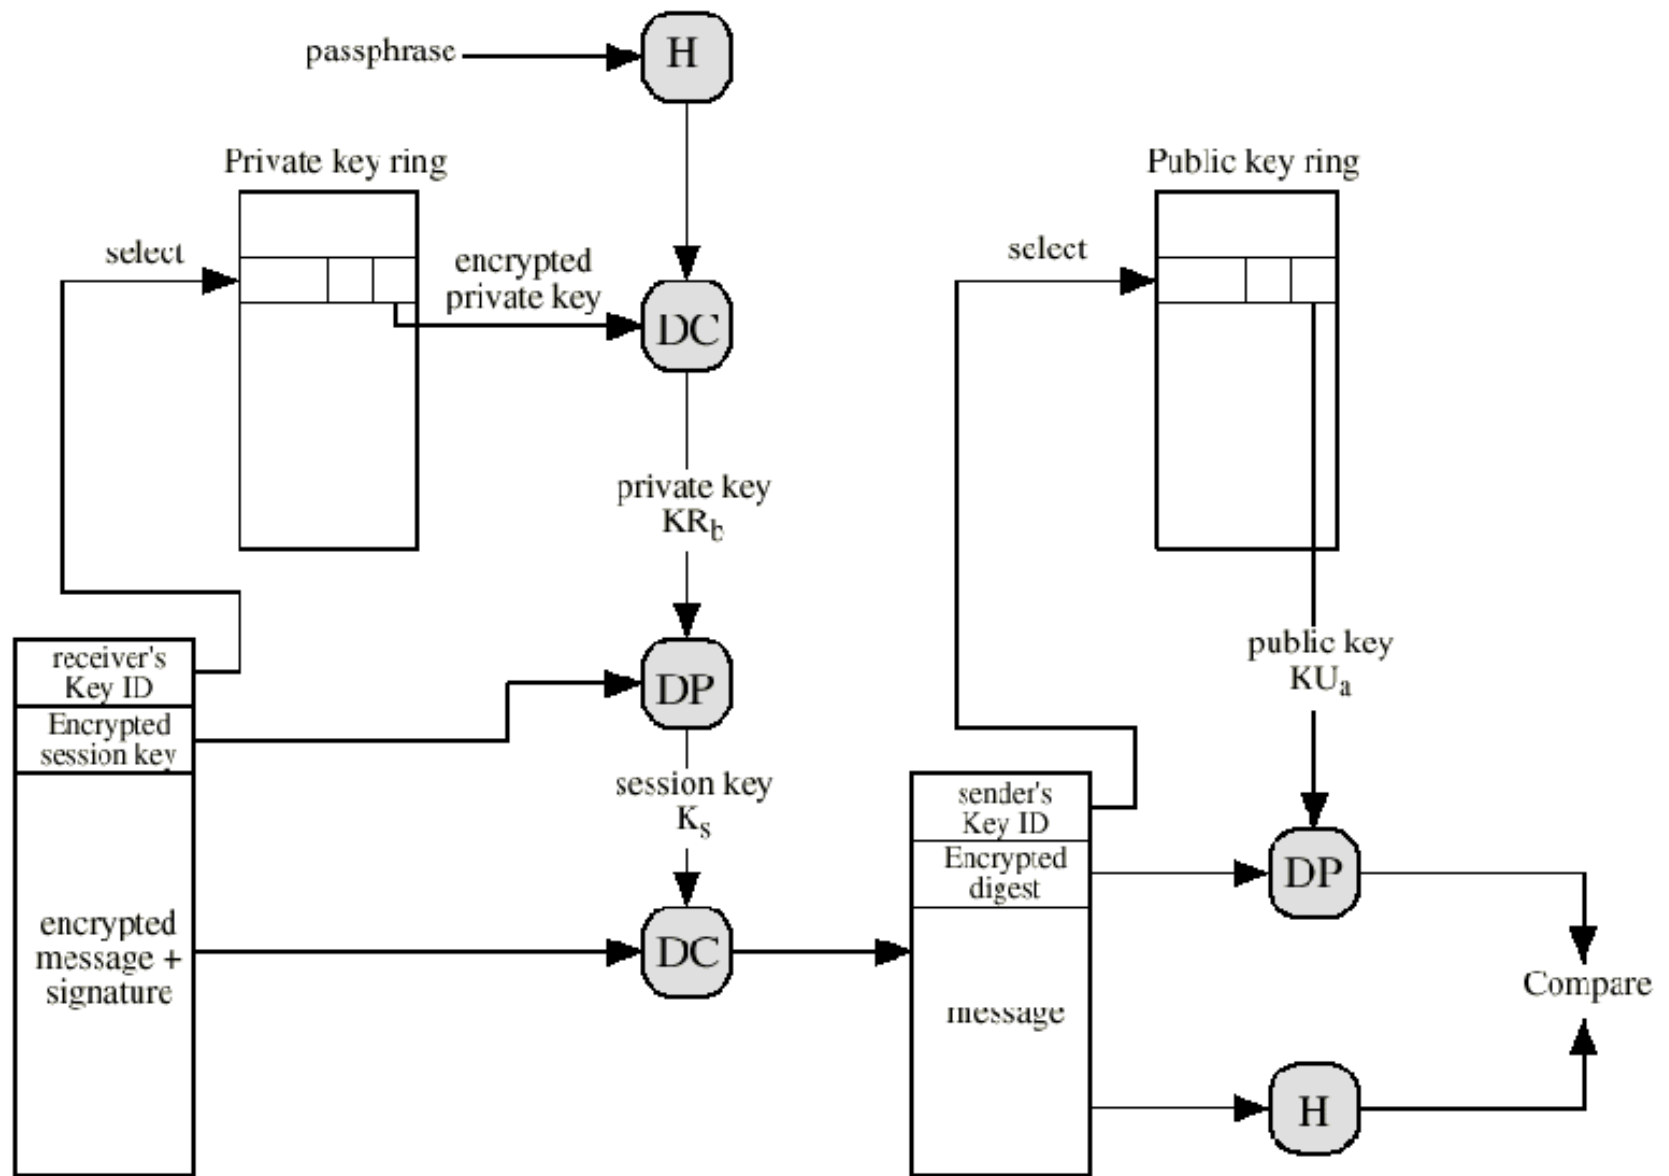

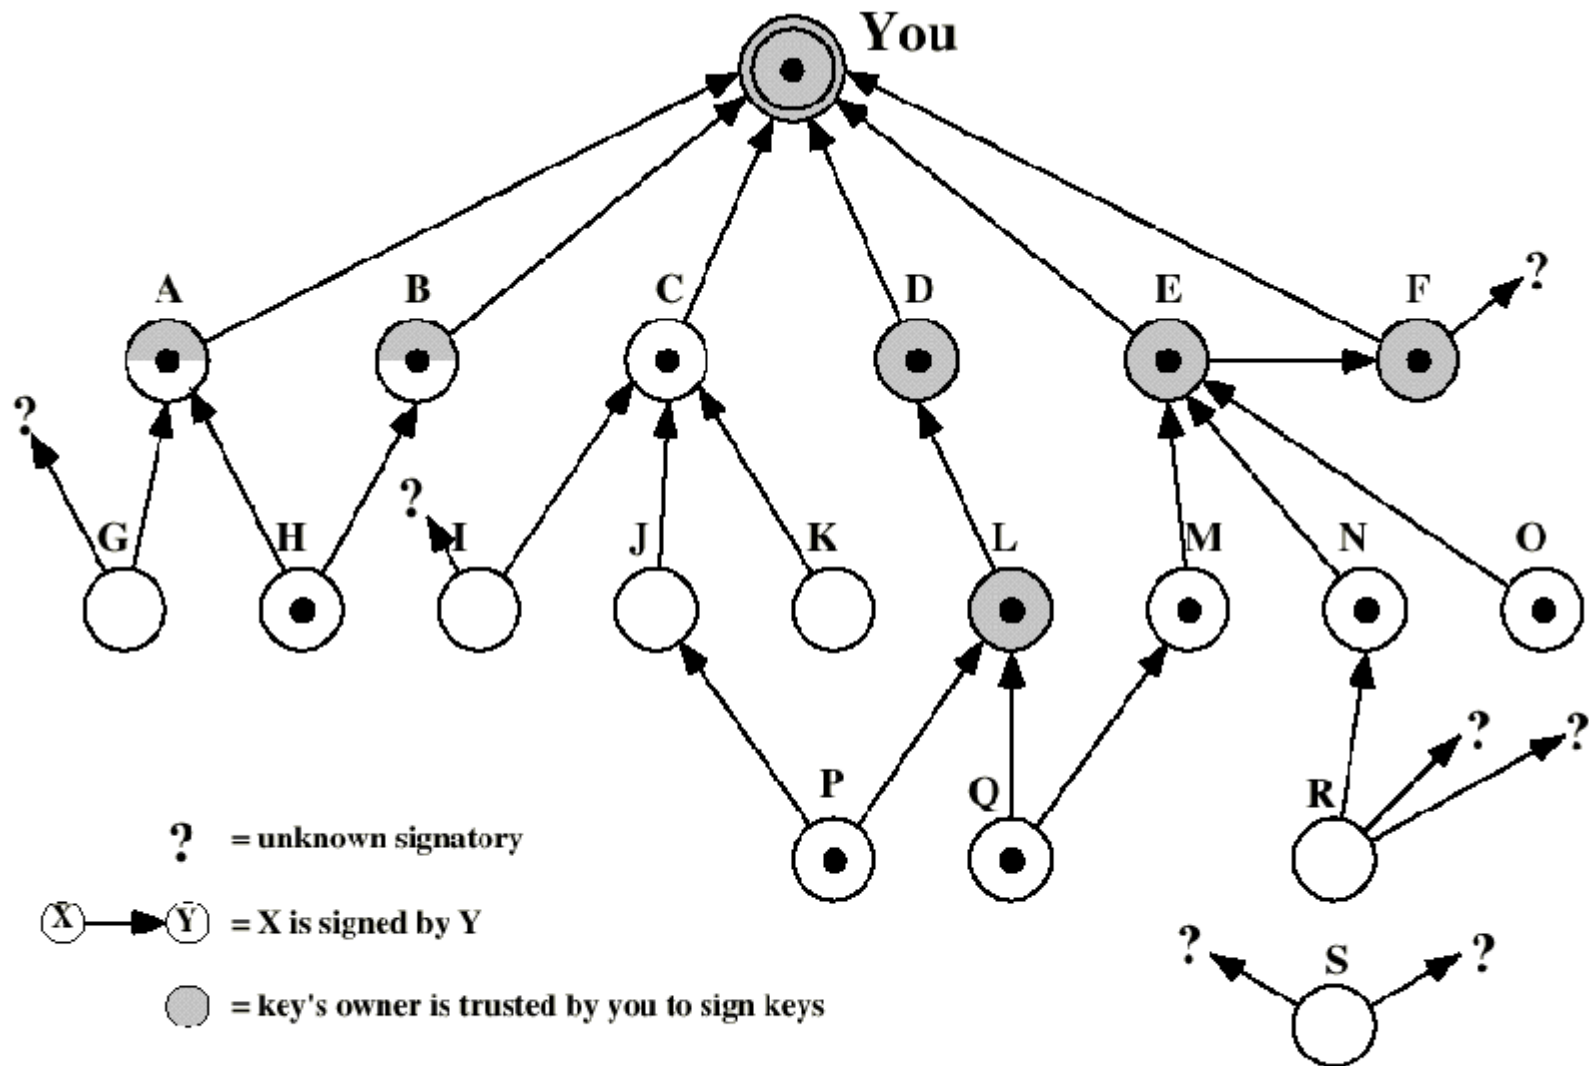

Figure 5.6 PGP Message Reception (from User A to User B; no compression or radix 64 conversion)

The Use of Trust

- Key legitimacy field
- Signature trust field
- Owner trust field

See Table 5.2
(W. Stallings)

Revoking Public Keys

- The owner issue a key revocation certificate.
- Normal signature certificate with a revoke indicator.
- Corresponding private key is used to sign the certificate.

S/MIME

- Secure/Multipurpose Internet Mail Extension
- S/MIME will probably emerge as the industry standard.
- PGP for personal e-mail security

Simple Mail Transfer Protocol (SMTP, RFC 822)

- **SMTP Limitations** - Can not transmit, or has a problem with:
 - executable files, or other binary files (jpeg image)
 - "national language" characters (non-ASCII)
 - messages over a certain size
 - ASCII to EBCDIC translation problems
 - lines longer than a certain length (72 to 254 characters)

Header fields in MIME

- **MIME-Version:** Must be "1.0" -> RFC 2045, RFC 2046
- **Content-Type:** More types being added by developers (application/word)
- **Content-Transfer-Encoding:** How message has been encoded (radix-64)
- **Content-ID:** Unique identifying character string.
- **Content Description:** Needed when content is not readable text (e.g.,mpeg)

S/MIME Functions

- **Enveloped Data:** Encrypted content and encrypted session keys for recipients.
- **Signed Data:** Message Digest encrypted with private key of "signer."
- **Clear-Signed Data:** Signed but not encrypted.
- **Signed and Enveloped Data:** Various orderings for encrypting and signing.

Algorithms Used

- **Message Digesting:** SHA-1 and MDS
- **Digital Signatures:** DSS
- **Secret-Key Encryption:** Triple-DES, RC2/40 (exportable)
- **Public-Private Key Encryption:** RSA with key sizes of 512 and 1024 bits, and Diffie-Hellman (for session keys).

User Agent Role

- S/MIME uses Public-Key Certificates - X.509 version 3 signed by Certification Authority
- Functions:
 - **Key Generation** - Diffie-Hellman, DSS, and RSA key-pairs.
 - **Registration** - Public keys must be registered with X.509 CA.
 - **Certificate Storage** - Local (as in browser application) for different services.
 - **Signed and Enveloped Data** - Various orderings for encrypting and signing.

User Agent Role

- **Example: Verisign (www.verisign.com)**
 - **Class-1:** Buyer's email address confirmed by emailing vital info.
 - **Class-2:** Postal address is confirmed as well, and data checked against directories.
 - **Class-3:** Buyer must appear in person, or send notarized documents.
